- The search for biomarkers
- Future directions

Cancer and the immune system

- 1863 – Virchow observed that tumours were infiltrated by leukocytes
- A link was proposed between cancer and inflammation

Rudolph Carl Virchow (1821-1902)

“The f unotherapy”

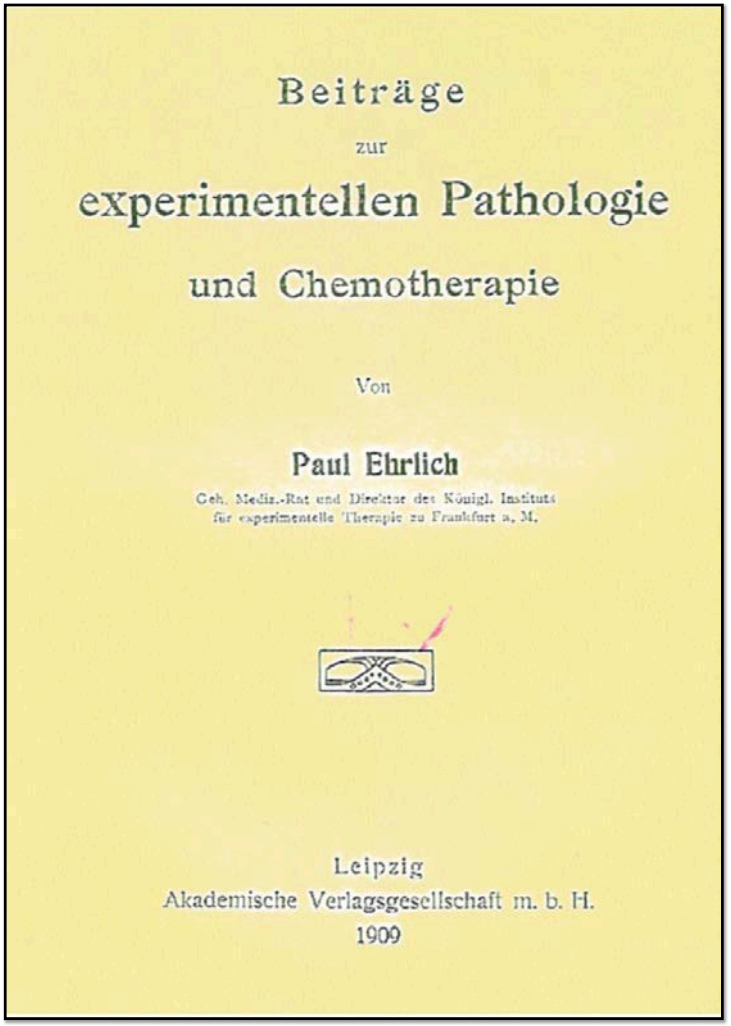
- 1891 – Co ccal bacterial to
- ‘Coley’s t ssue sarcoma fo success

Fig. II.—Dr. Coley's Case of Sarcoma of Lower End of Femur. Patient Showing Granulating Surfaces Produced by the Erysipelas Culture.

William Coley (1862-1936)

Paul Ehrlich

(1854 –1915)



Paul Ehrlich: Birth of Targeted Therapy

(1) Antibodies: Nobel Prize for serum therapy in 1908
(2) Targeted chemotherapy: 1910-1911

Receptors on cells

Postulated "side-chains," or "receptors" specific for external substances (dyes), antigens, and nutrients

A bacterial toxin *and* a targeted chemotherapy

Model: bifunctional agent, containing a chemical structure that binds to the "receptor" linked to a toxic molecule

Mendelsohn, J. (2013). Personalizing oncology: perspectives and prospects. *JCO*, *31*(15), 1904–11.

The first targeted therapies

- Huggins demonstrated the hormone-dependency of prostate cancer
- In 1940, oestrogen therapy for prostate cancer became the first targeted systemic therapy, against receptors or pathways upon which a cancer was dependent

Charles Huggins (1901-1997)

Chemotherapy – emerging from the horrors of chemical warfare

2 Dec 1943 - The 'Bari incident'

SS *John Harvey*

Current status of olaparib (Lynparza)

- **Australia** – TGA approved

  "Olaparib is indicated as monotherapy for the **maintenance treatment** of patients with platinum-sensitive relapsed BRCA-mutated (germline or somatic) high grade serous epithelial ovarian, fallopian tube or primary peritoneal cancer who are in response (complete response or partial response) after platinum-based chemotherapy. Prior treatment must have included at least 2 courses of platinum-based regimens."

- **Europe** – approved as **maintenance treatment** for platinum sensitive relapsed BRCA m ovarian cancer –patients in remission following platinum-based therapy

- **USA** - approved as monotherapy
  - For patients who have received ≥ ?3 lines of chemotherapy
  - **Not** approved as maintenance therapy
  - Approval also for companion diagnostic (Myriad Genetics BRCA analysis CDx)

Table 2 Ongoing phase III studies of PARP inhibitors for ovarian cancer treatment

Trial and NCI trial number	Study arms	Trial population	Primary endpoint	Total accrual	Trial status
Newly diagnosed ovarian cancer					
SOLO1 (NCT01844986)	Olaparib versus placebo post-platinum-based chemotherapy	BRCAm only, HGSOC, or endometrioid stage III and IV only	PFS	344	Accrual completed; results pending
GOG-3005 (NCT02470585)	Carboplatin and paclitaxel versus carboplatin, paclitaxel, and veliparib versus carboplatin, paclitaxel, and veliparib followed by veliparib maintenance therapy	Advanced HGSOC, both BRCAm and BRCAwt	PFS	1100	Accrual ongoing
PAOLA1 (NCT02477644)	Platinum/taxane/bev, bev maintenance versus platinum/taxane/bev, bev/olaparib maintenance	Newly diagnosed high-grade ovarian cancer	PFS	612	Accrual ongoing
Recurrent ovarian cancer					
NOVA (NCT01847274)	Niraparib versus placebo post platinum-based chemotherapy	Platinum-sensitive, HGSOC, BRCA-stratified	PFS	360	Accrual completed; results pending
SOLO2 (NCT01874353)	Olaparib versus placebo post platinum-based chemotherapy	Platinum-sensitive BRCAm only, HGSOC, or endometrioid	PFS	264	Accrual completed; results pending
ARIEL3 (NCT01968213)	Rucaparib versus placebo post-platinum-based chemotherapy	Platinum-sensitive recurrence, HGSOC or endometrioid BRCA-stratified	PFS	540	Accrual ongoing
SOLO3 (NCT02282020)	Olaparib versus MD choice non-platinum chemotherapy	Platinum-sensitive BRCAm HGSOC	PFS	411	Accrual ongoing
NRG-GY004 (NCT02446600)	Olaparib versus olaparib/cediranib versus platinum doublet	Platinum-sensitive recurrent high-grade ovarian cancer BRCA-stratified	PFS	450	Accrual ongoing
NRG-GY005 (NCT02502266)	Olaparib/cediranib versus single-agent chemotherapy	Platinum resistant recurrent high-grade ovarian cancer	PFS (ph 2) OS (ph 3)	680	Accrual ongoing

HGSOC high-grade serous ovarian cancer, *BRCAm* BRCA mutation carrier, *PFS* progression-free survival, *Bev* bevacizumab

Liu, J. F., & Matulonis, U. A. (2016). *Current Oncology Reports*, *18*(5), 29

What about toxicity?

Chemotherapy	Targeted therapies	Immunotherapy
• Neutropenia / immune suppression • Hair loss • Nausea and vomiting • Lethargy	• Skin rash • GI effects (diarrhoea, nausea) • Drug induced liver injury • 'off-target toxicity' e.g. skin SCC	• NOT immune suppressive • Immune-related side effects • Skin (rash, pruritis) • Diarrhoea / colitis (<5%) • Pneumonitis (<3%) • Endocrine • Any auto-immune '-itis'

Immune checkpoint blockade (ICB) toxicities

Frequent (>10%) ICB toxicities

- Ipilimumab (anti-CTLA4): diarrhea, rash, pruritus, fatigue, nausea, vomiting, decreased appetite and abdominal pain
- Nivolumab (anti-PD1): fatigue, rash, pruritus, diarrhea and nausea
- Pembrolizumab (anti-PD1): diarrhea, nausea, pruritus, rash, arthralgia and fatigue

Rare (<10%) life-threatening ICB toxicities

- Colitis and risk of gastrointestinal perforation
- Pneumonitis including acute interstitial pneumonia / ARDS
- Infusion reaction and anaphylactic shock
- Type 1 diabetes and risk of diabetic ketoacidosis
- Severe skin reactions, DRESS, Stevens Johnson syndrome
- Hemolytic anemia or immune thrombocytopenia and hemorrhagic risk
- Neutropenia and sepsis risk
- Encephalopathy and neurological sequelae
- Guillain–Barré syndrome and respiratory risk
- Myelitis and motor sequelae
- Myocarditis and cardiac insufficiency
- Acute adrenal insufficiency and hypovolemic shock
- Pleural and pericardial effusion
- Nephritis

Champiat, S. et al. (2016). Management of immune checkpoint blockade dysimmune toxicities: a collaborative position paper. *Annals of Oncology*, *27*(4), 559–574.

The five pillars of immunotherapy toxicity management

Neoantigens in cancer immunotherapy

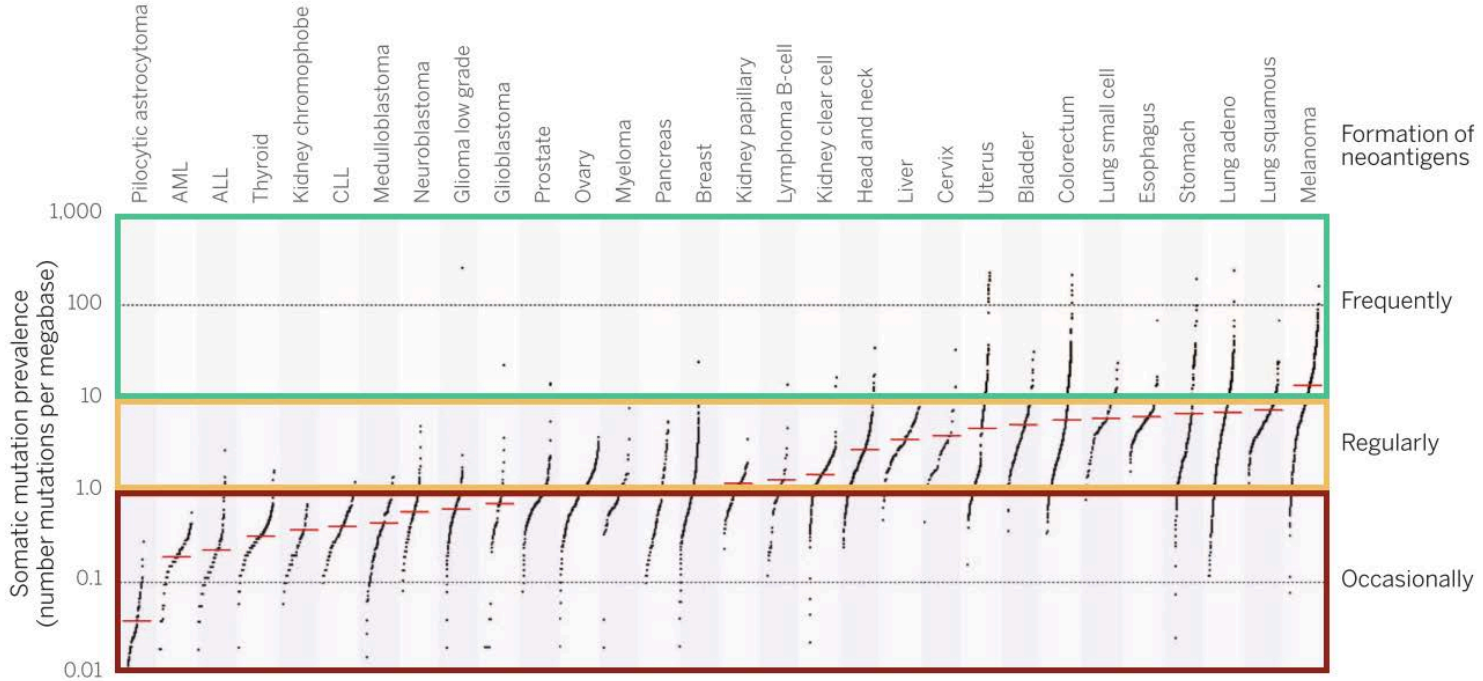

Fig. 2. Estimate of the neoantigen repertoire in human cancer. Data depict the number of somatic mutations in individual tumors. Categories on the right indicate current estimates of the likelihood of neoantigen formation in different tumor types. Adapted from (*50*). It is possible that the immune system in melanoma patients picks up on only a fraction of the available neoantigen repertoire, in which case the current analysis will be an underestimate. A value of 10 somatic mutations per Mb of coding DNA corresponds to ~150 nonsynonymous mutations within expressed genes.

Schumacher, T. N. & Schreiber, R. D. (2015). *Science*, *348*(6230), 69–74. doi:10.1126/science.aaa4971

Neoantigens in cancer immunotherapy

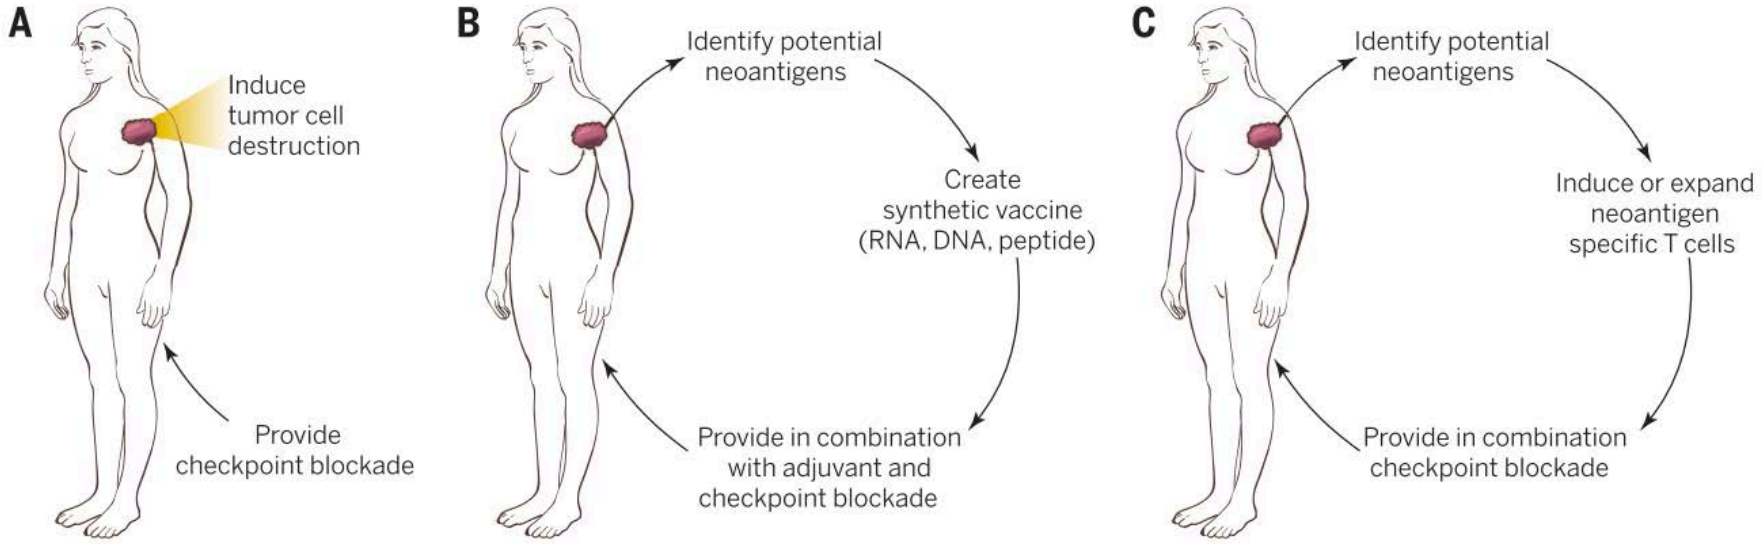

Fig. 4. Strategies to target the patient-specific neoantigen repertoire. (**A**) Immunotherapy is given in combination with interventions such as radiotherapy that enhance exposure to autologous neoantigens. (**B**) Potential neoantigens are identified as in Fig. 1 steps 1 to 3, a patient-specific vaccine is produced, and this vaccine is given together with adjuvant and T cell checkpoint-blocking antibodies. (**C**) Potential neoantigens are identified as in Fig. 1 steps 1 to 3, T cells that are specific for these neoantigens are induced or expanded in vitro, and the resulting T cell product is given together with T cell checkpoint-blocking antibodies.

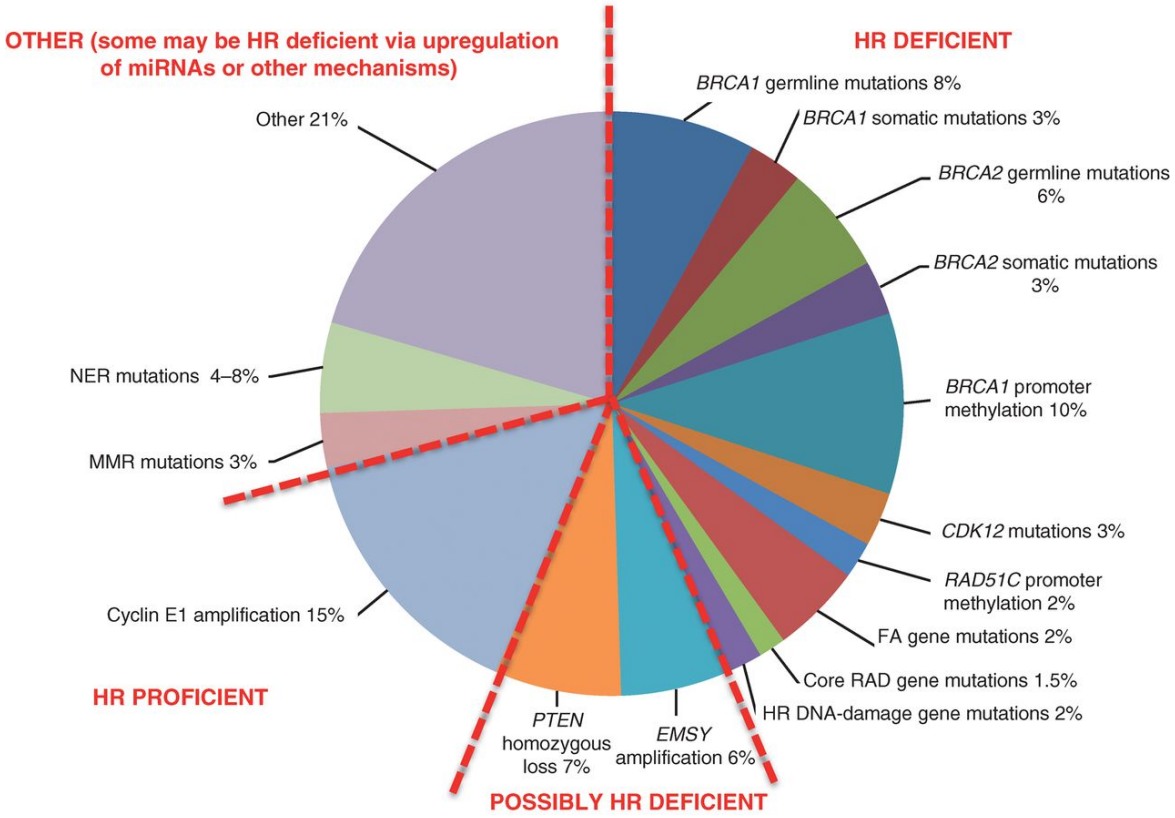
Biomarkers of PARPi response

- BRCA1/2 germline mutations (~14% of high-grade serous EOC)
- BRCA ½ somatic mutations (~6%)
- Other genetic and epigenetic alterations in HR genes ?>30%

Approximately 50% of high-grade serous EOCs have alterations in HR repair genes.

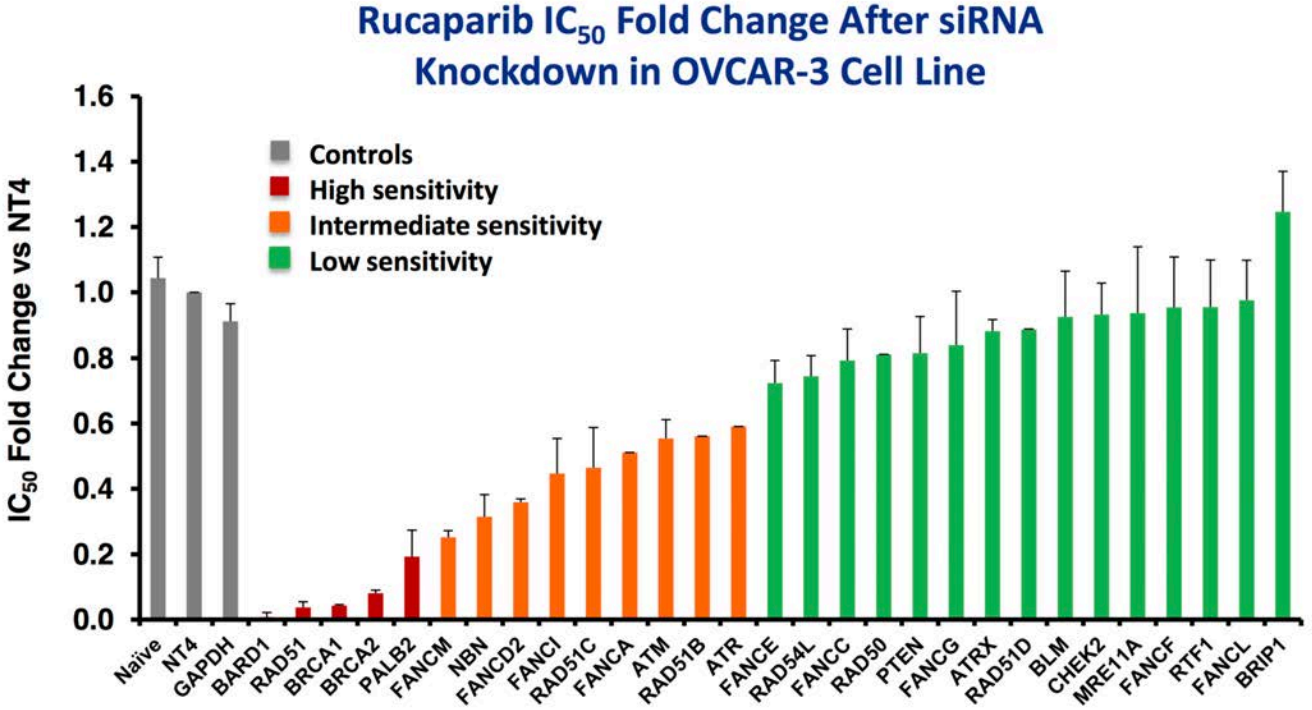


Konstantinopoulos et al. Cancer Discov 2015;5:1137-1154

Homologous recombination deficiency (HRD) assays

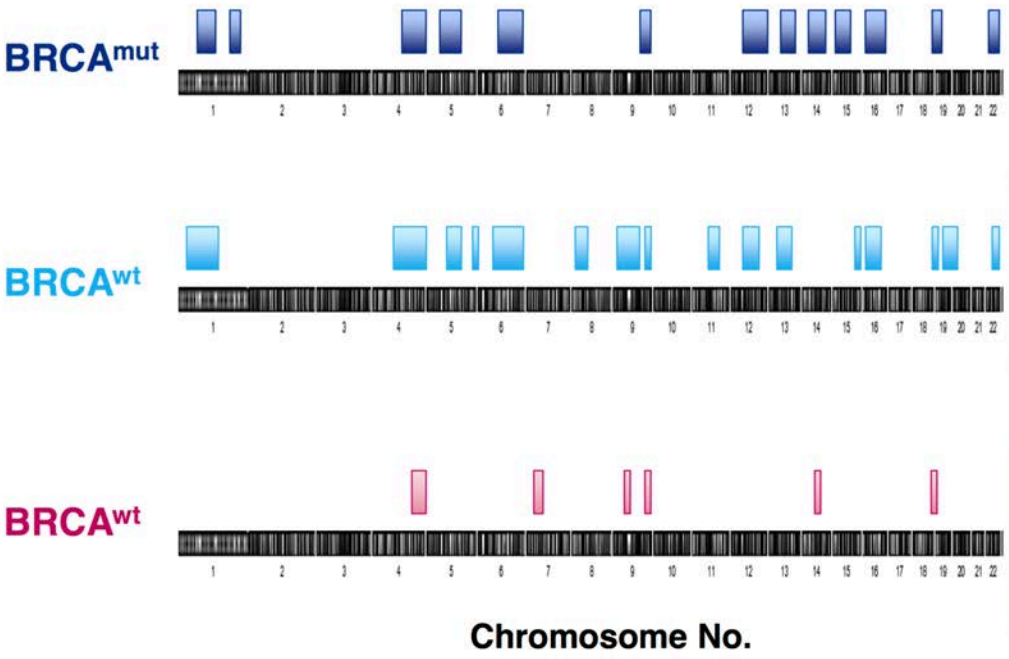
Validation, validation, validation!!

Defining a BRCA-like signature through single gene analysis is complex – not all genes are functionally relevant



IC_{50}=half maximal inhibitory concentration.

HRD causes genome-wide loss of heterozygosity (LOH) that can be measured by comprehensive genomic profiling based on NGS



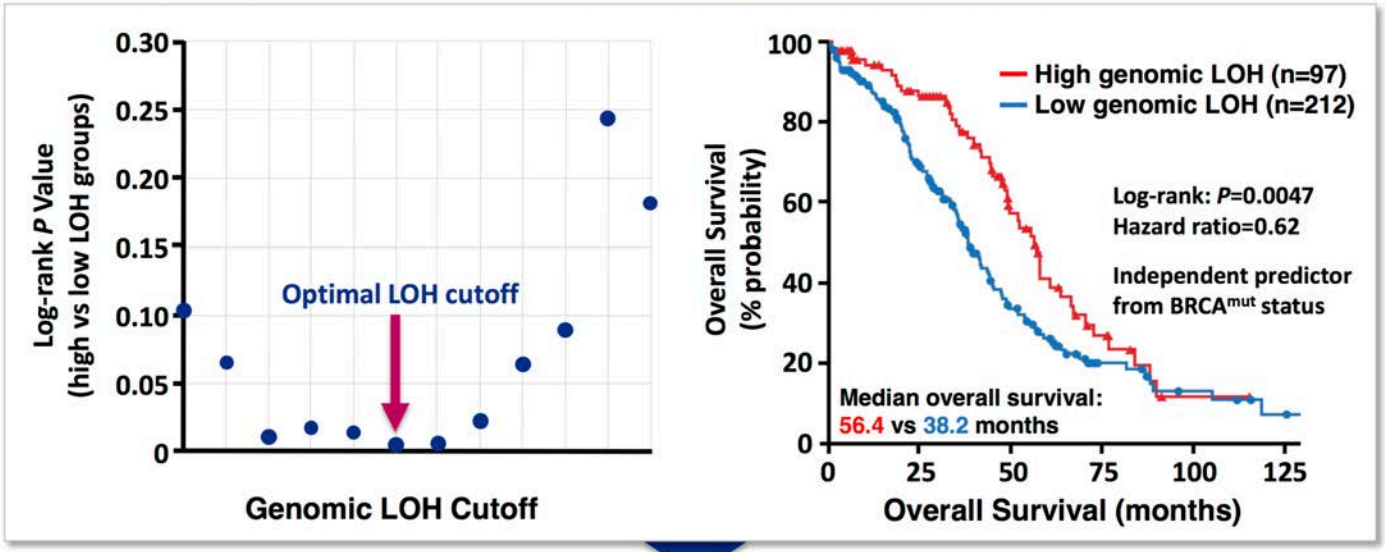
Hypothesis 1:
Ovarian cancer patients with high genomic LOH suggesting BRCA-like signature will respond to PARPi.

Hypothesis 2:
Ovarian cancer patients who are "biomarker negative" (ie, with low genomic LOH) will not respond to PARPi.

mut=mutation; NGS=next-generation sequencing; wt=wild type.

Diagnostic development: Cutoff defined for BRCA-like signature, being tested and refined

TCGA and AOCS Overall Survival Data Used to Develop LOH Cutoff to Identify High-Grade Ovarian Cancer Patient Tumors with BRCA-Like Signature



Prospective testing of prespecified cutoff in ARIEL2 and ARIEL3

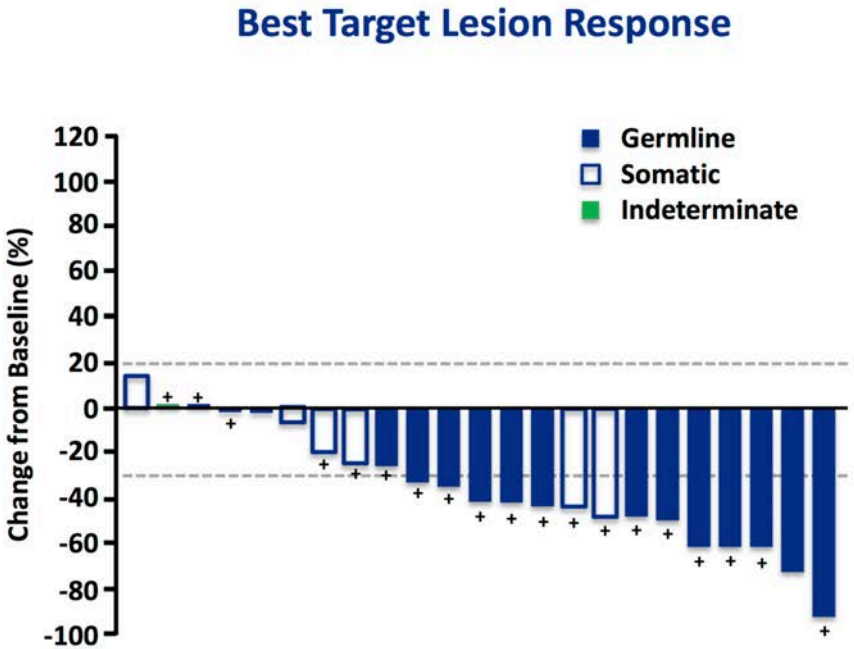
Greatest rucaparib activity observed in BRCA^{mut} patients…

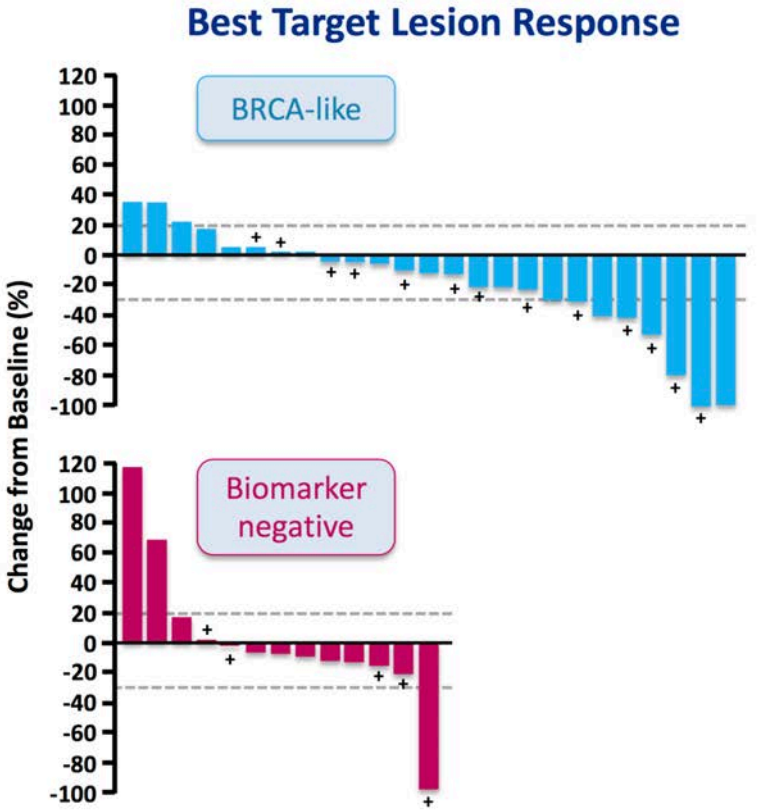
- Robust clinical activity observed in BRCA^{mut} patients (n=23)
  - 61% ORR (RECIST)
  - 70% ORR (RECIST & CA-125)
  - 83% of patients continuing on treatment (+)
- Responses observed in germline and somatic BRCA^{mut} tumors



+=ongoing.

…and differential rucaparib activity seen in patients with/without BRCA-like signature

- Clinical activity observed in BRCA^{wt} patients **with** BRCA-like signature (n=25)
  - 32% ORR (RECIST)
  - 40% ORR (RECIST & CA-125)
  - 52% of patients continuing on treatment (+)
- Few responses observed in BRCA^{wt} patients **without** BRCA-like signature (n=13)
  - 8% ORR (RECIST)
  - 8% ORR (RECIST & CA-125)
  - 38% of patients continuing on treatment (+)



+=ongoing.

Box 1 | **Immunotherapies that are approved or in development**

Vaccines

- Dendritic cell-based vaccines
- Autologous granulocyte–macrophage colony-stimulating factor (GM-CSF)-transfected vaccines
- Viral vector vaccines
- mRNA-based vaccines
- Multipeptide-based vaccines
- Locally released virotherapy

Targets of modulatory monoclonal antibodies

- Cytotoxic T lymphocyte-associated antigen 4 (CTLA4)
- Programmed cell death protein 1 (PD1)
- PD1 ligand 1 (PDL1)
- CD137
- OX40
- Lymphocyte activation gene 3 protein (LAG3)
- T cell immunoglobulin and mucin-domain containing 3 (TIM3)
- Glucocorticoid-induced tumour necrosis factor receptor family-related protein (GITR)
- CD27

Adoptive T cell therapy

- Tumour-infiltrating lymphocytes
- Chimeric antigen receptors (CARs)
- CAR-transduced T lymphocytes
